

# How to Think Through Your Options

A few honest questions before your consult.

There's no wrong answer here — only the answer that's actually yours.

## THREE THINGS PEOPLE USUALLY GET WRONG

### 1 "I'll never need glasses again."

Advanced lenses can still mean glasses for one task — that's normal, not a shortfall.

### 2 "Needing glasses means it failed."

Occasionally reaching for glasses with an advanced lens doesn't mean it failed.

### 3 "Medicare covers whatever I choose."

Medicare covers standard surgery and lens fully — not the advanced options.

## BEFORE YOUR CONSULT, THINK THROUGH THIS

### 1 How do you feel about wearing glasses day to day?

### 2 Do you drive at night? Any trouble with headlight glare?

### 3 How much of your day involves reading — books, menus, labels?

### 4 How much time do you spend on your phone, tablet, or computer?

### 5 Any hobbies or activities where your vision really matters to you?

## THE ONE TRADE-OFF THAT MATTERS MOST

If you had to pick one: full range of vision, with a higher chance of noticing halos and glare at night — or fewer visual side effects, with glasses kept on hand for close-up work.

Full range matters more to me

Fewer side effects matters more

My answer, in my own words:

If this feels like a lot, that's normal. Maybe it's the unfamiliar terms piling up faster than they make sense. Maybe it's not wanting to ask a "silly" question out loud, or knowing this decision is permanent and not wanting to get it wrong. Or maybe it's just too many options and not enough time to sort through them. Whatever it is, you're not the only one who feels that way — and there's no prize for sorting it out alone.

## Ready for more than a worksheet?

The IOL ClarityIQ Session is a live, guided conversation — at your pace, no question too small.
