

Know Your Lens Options

Five categories, real tradeoffs, no jargon.

There's no single best lens — only the one that fits how you actually live.

1 Monofocal

One focal point, chosen with your surgeon. Fully covered by insurance.

ADVANTAGES

- Sharp, clean optics with low halo and glare
- No out-of-pocket cost — fully covered by insurance
- Long track record, well-understood recovery

TRADE-OFFS

- One focal point — other distances need glasses
- Doesn't correct astigmatism
- Requires choosing which distance matters most

2 Toric

Same single focal point as monofocal, built to also correct astigmatism.

ADVANTAGES

- Genuinely sharp vision at your chosen distance
- Same reliable single-focal-point design
- Precise alignment confirmed at post-op visits

TRADE-OFFS

- One focal point — other distances need glasses
- Out-of-pocket cost, not covered by insurance
- Requires choosing which distance matters most

ADVANCED TECHNOLOGY (ATIOL)

3 Multifocal

Designed to give a fuller range, including up-close reading.

ADVANTAGES

- Least dependence on glasses across all ranges
- Full reading vision built into the design
- Most established advanced-technology option

TRADE-OFFS

- More noticeable halos and glare at night
- Adaptation period as your brain adjusts
- Out-of-pocket cost, not covered by insurance

4 EDOF

Extended depth of focus — a continuous stretch of clear range.

ADVANTAGES

- Strong distance and intermediate vision
- Fewer halos and glare than multifocal
- Smooth range, not distinct focal jumps

TRADE-OFFS

- May still want glasses for fine print
- Adaptation period as your brain adjusts
- Out-of-pocket cost, not covered by insurance

5 Other

IC-8 and Light Adjustable Lens — tailored, per-eye approaches.

ADVANTAGES

- Customized to how your two eyes work together
- LAL can be fine-tuned after surgery
- Built for a tailored, individual approach

TRADE-OFFS

- More involved surgical planning
- LAL requires additional office visits
- Less commonly used than other options

RANGE ACCURACY — BY LENS AND TARGET

Monofocal — set for distance	D I N	No astig.	Minimal halo
Monofocal — set for near	D I N	No astig.	Minimal halo
Toric — set for distance	D I N	Corrected	Minimal halo
Toric — set for near	D I N	Corrected	Minimal halo
EDOF	D I N	Corrected	Some halo
Multifocal	D I N	Corrected	More noticeable
IC-8 / LAL *	Varies by eye — planned with your surgeon		

D = distance · I = intermediate · N = near. Filled dot = clear without glasses at that range. Gray = glasses typically needed. Amber = variable, glasses sometimes needed. Astigmatism-correcting versions exist across every lens category — "Corrected" reflects that toric build. Monofocal and toric are set to one target range by you and your surgeon before surgery — the range not chosen will need glasses. * IC-8/LAL use a per-eye strategy rather than one profile across all three ranges.

Not sure which applies to you?
